## Logging into the App

To login to the izzbie app, enter your username and password on the “Login” screen, and then click “Login,” as shown in the following illustration.

## Status

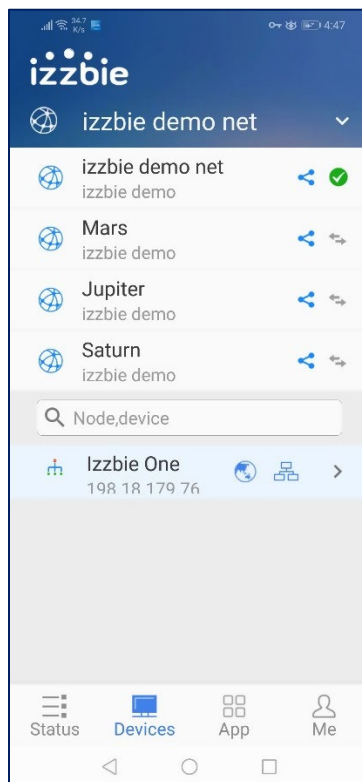

The “Status” screen, shown below, is the first screen that you see when you log in to the app.

## Nets

Selecting the “Nets” option on the “Main Menu” displays the “Nets” screen, shown in the illustration below.

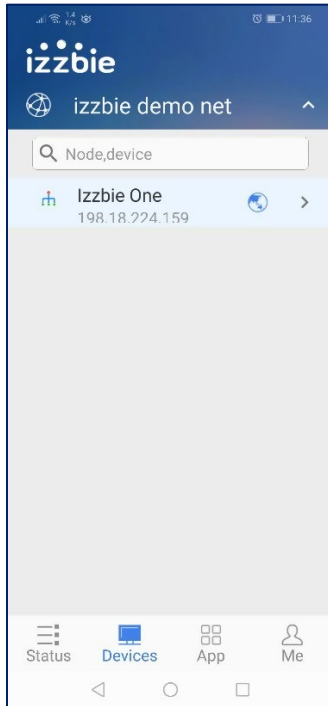

- A Net is a Virtual Mesh Network that is linked to a user account. By default, you have one Net.
- If you joined other users' Nets, they would be selectable here.
- You must switch in one of the Nets to access the networks under the Net.

## Devices

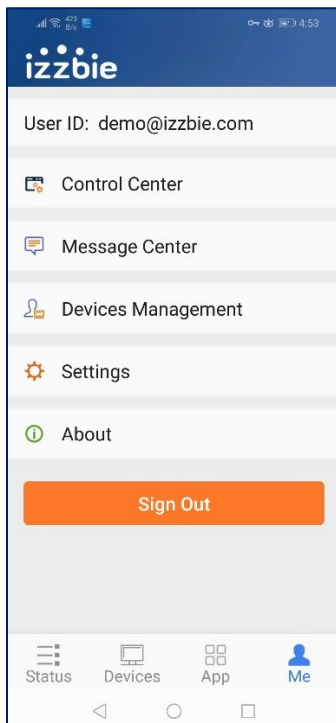

Selecting the “Devices” option on the “Main Menu” displays the “Devices” screen, as shown in the illustration below.

- It displays all current logon devices on the selected Virtual Net
- You may use the remote device's Virtual Domain Name or Virtual IP to connect (for example, RDP or Map drive)
- Click the small “ic” to copy the Virtual Domain Name or Virtual IP Address.

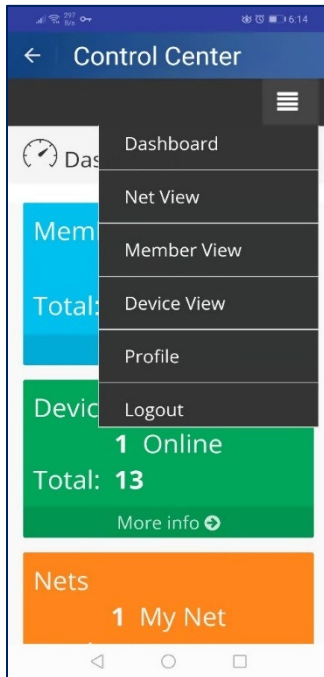

## Me Tab

The “Message Center” is for reviewing system messages and joint request approval. Select “Devices Management” to configure share, add, remove, reboot, rename and access permissions, or select “Settings” to change encryption method.

## Control Center

Click "Control Center" to manage Users, Nets, and Device settings.

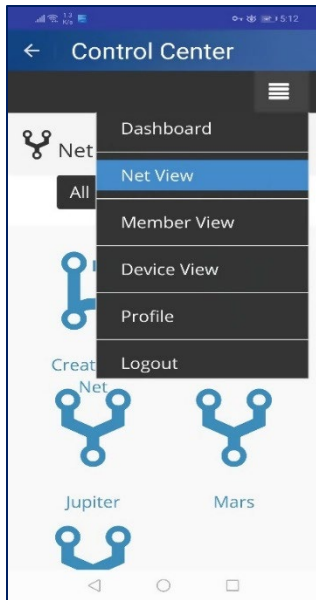

## Control Center Dashboard

Display System messages and information.

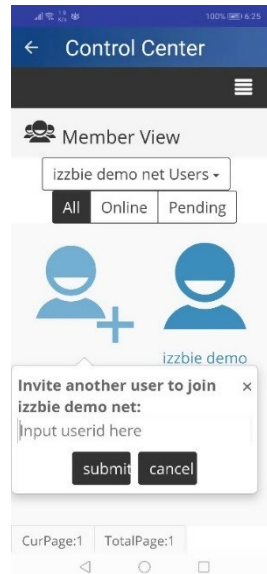

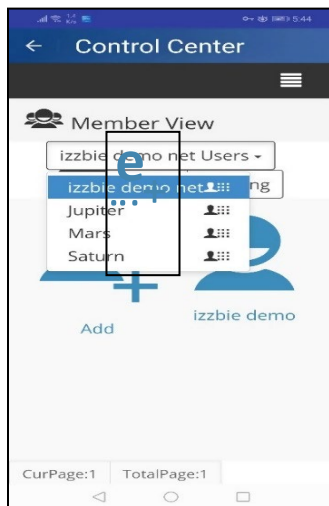

## Control Center Net View

- Manage your virtual networks here.
- Invite others to join your network.

## Control Center Member View

You can see all the members that belong to your Net here.

You can also invite and delete other users to your Net.

## Control Center Device View

- All of the devices that are bound to your account are displayed here.
- Devices that are currently connected to the Net are displayed in blue color.
- Devices that are not connected are displayed in grey color.

### Desktop

- Devices with the izzbie app installed and logged in to the same user account are also within the Net.
- Devices include desktops, laptops, tablets, and smartphones.
- These devices are accessible without going through izzbie ONE.

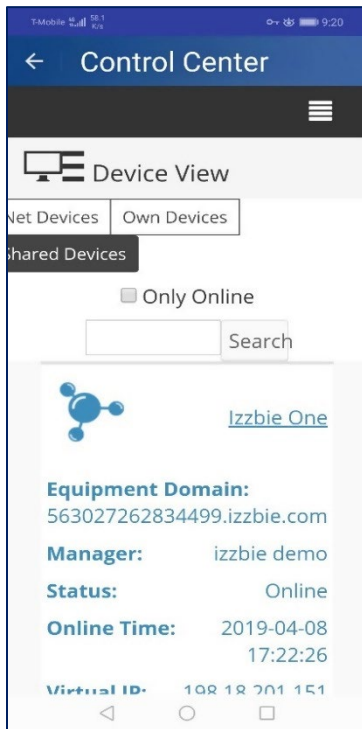

### CHLOE-Office Izzbie ONE

- This is the izzbie ONE icon. It connects a local area network subnet
- It allows remote access to devices that are not installed izzbie client (for example, print and IP camera)

## Configure the izzbie ONE Device

In order for Subnet Devices to be accessible, you will need to first add them to the izzbie ONE.

- Select “Shared Devices” and click on the izzbie ONE “Device Name” for configuration.
- Click the “Pencil” icon to change Device Name.
- Click “User Manage for users.
- Click Modify SmartNode for Access Internet by SmartNode.
- For browsing the internet through a designated LAN, check “Access internet by SmartNode.”
- Input your ISP’s DNS address.

## Configuration for Access Subnet Devices

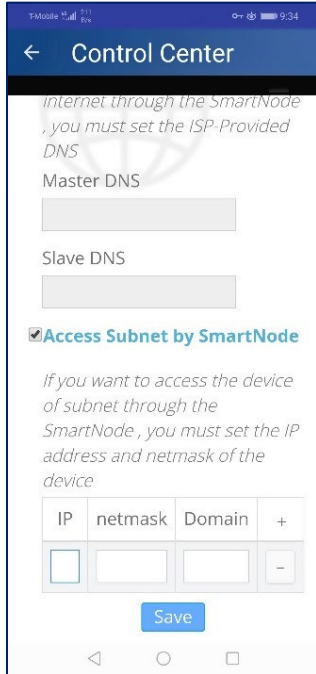

Click the “+” Icon then input the IP address of the devices you want to access remotely.

Enter 255.255.255.255 as the Netmask.

Once you have finished adding the subnet IP and netmask, and then click "Save."

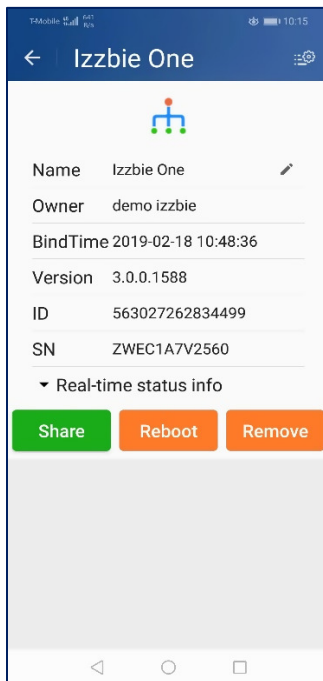

The number of subnet IPs that can be added is based on the Account Level. The Basic Account starts with three Subnet IPs.

You can add devices such as network printers, NAS, servers, IP cameras, etc.

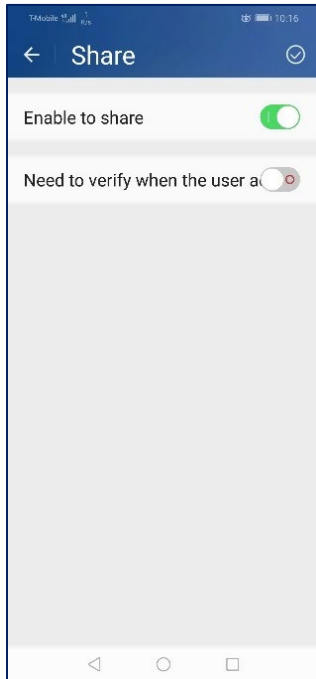

## Devices Management

- Add new device and share your SmartNode.
- Click your izzbie ONE device.
- Share your izzbie ONE

- Click the “Share” button.

- Switch on the “Enable to share” button.
- The “Need to verify” button needs to be on if you want access permission to get approval.
